

Online Event Management System

<https://github.com/aivshwary/Online-Event-Management-System>

OVERVIEW

A database-driven system for managing events end-to-end, allowing customers to register, browse and book events, while administrators have full control over event listings, users, payments and preferences.

IMPACT

Designed and implemented a normalized relational database and NoSQL schema for an Online Event Management System, handling user registration, booking workflows, discount management, and payment processing.

KEY DETAILS

1. Designed a fully normalized relational schema (up to 3NF) with entities for Users, Events, Bookings, and Payments.
2. Modeled equivalent NoSQL document structures for flexible event-type storage and preference management.
3. Admin interface supports CRUD operations on events, user management, and discount configuration.
4. Customer portal enables account creation, event browsing, booking with preference selection, and payment processing.
5. Schema documented with ER diagrams, normalization steps, and a detailed project report.
